“Many are the trials I’ve had With the mortals here, Their bodies offered to my trust, To cut and sew and maybe cure.”

-John Heysham Gibbon, Jr., 1960

On May 6, 1953 at Jefferson Medical College Hospital, Dr. John Heysham Gibbon, Jr., his staff, and with the help of his latest-designed heart-lung machine, “Model II,” closed a very serious septal defect between the upper chambers of the heart of eighteen-year-old Cecelia Bavolek. This was the first successful intercardiac surgery of its kind performed on a human patient. Mr. Baroek was connected to the device for three-quarters of an hour and for 26 crucial minutes, the patient totally depended upon the machine’s artificial cardiac and respiratory functions. “Jack” Gibbon did not follow this epoch-making event by holding an international press conference or by swiftly publishing his achievements in a major medical journal. In fact he later recalled that he was the first and only time that he did not write his own operative notes (which were supplied by Dr. Robert K. Finley, Jr.).

According to a recent and only time that he did not write his own biographical review by C. Rollins Hanlon, Philadelphia surgeon.”
