Fig. 1. The absorbents from the nipple to the axilla, placed upon the axillary vein, whence they mount to the under part of the clavicle, passing through the absorbent aperture to terminate in the angle of the conjoined jugular and subclavian veins of the right side, at the lower part of the neck.

- The nipple with two absorbents from it passing upon the fourth rib, and then dividing into numerous branches which cover the intercostal spaces up to the third and down to the fifth rib. They then mount to the third rib to the axillary vein, and pass on the inner side of that vein under the clavicle, where they are continued, through the absorbent aperture, into the angle of the jugular and subclavian veins.

- The subclavian artery.
- Axillary plexus of nerves.

Fig. 2. Shows the absorbent, passing under the blood-vessels, the axillary vein, the artery, across four of the upper ribs, joining with the anterior, entering the angle of the jugular and subclavian of the right side at d.

- The axillary plexus of nerves.

Fig. 3. Absorbents from the nipple and areola passing into a cluster of absorbents in the axilla, to an absorbent gland there.

Fig. 4. A diagram of the termination of the absorbents of the arm and breast, the thoracic duct and its termination, the absorbents of the neck on the left side, the absorbents of the arm.

Fig. 5. This diagram shows the termination of the absorbents from the arm and neck on the right side, in the angle of the jugular and subclavian vein.
