ANNUAL ANNOUNCEMENT OF JEFFERSON MEDICAL COLLEGE OF PHILADELPHIA. SESSION 1842—1843. PHILADELPHIA: MERRIWHEW & THOMPSON, PRINTERS, No. 7 CARTER'S ALLEY. 1842.
The Faculty of Jefferson Medical College, in issuing their annual announcement for the Session of 1842-'3, deem it their duty to the Alumni of the Institution, and the profession at large, to present a succinct account of the present condition of the School, and of the advantages which it affords for the successful prosecution of medical studies.

Nearly twenty years have elapsed since the first establishment of the College, during which it has experienced various changes in the constitution of the Faculty, and has successfully encountered the impediments and embarrassments which are incident to the early steps of all enterprises. Its progress has never been interrupted, even for a season; and its career has been one of signal success. Of the large numbers who have received instruction in its halls, many hundreds bear with them its highest honors, and are among the reputable and distinguished practitioners of this wide spread country. Many have been received into the army and navy, and some have been called to professorships in respectable medical schools. The present organization of the Faculty is believed to be of the most settled character. The members have been long known to each other, and to the community in which they reside,—are connected with many of the public institutions of the city, and especially with those that appertain to medicine,—are permanently established in the place, and actively engaged in the practice of the various branches of their profession.

During the past session, full courses of lectures were delivered by the incumbents of the several chairs, and in a manner to elicit the published expression of satisfaction on the part of the class, which embraced many graduates and practitioners of experience, and was more numerous than any in attendance during several preceding years. Cheered by these assurances of success, the Faculty are resolved to spare no pains to justify the professional confidence and support which has been so liberally accorded them.

For the information of students and members of the profession at a distance, they submit the following account of the Institution, and of the means of instruction at their command:
I. COLLEGE BUILDINGS.

The buildings of the College are on Tenth street, between Chestnut and Walnut streets, near the centre of the city, and in the vicinity of boarding houses, hotels, and places of worship;—they were erected expressly for the purposes of the College, and were constructed less with reference to display than utility. They contain two capacious lecture rooms, large enough to accommodate upwards of four hundred and fifty students, and arranged after the most approved plans, so as to afford to every student an opportunity to see and hear all that is exhibited and spoken by the professors: they are warmed, ventilated, and lighted,—at night by gas. These lecture rooms, with the private apartments of the professors, and those of the janitor, occupy the front. The back part consists mainly of two large halls, each more than fifty feet long;—the lower, provided with an extensive gallery, and containing the Museum and certain of the Cabinets;—the upper, an extensive hall, with high vaulted ceiling, sky lights, &c., devoted to the purposes of practical anatomy. It is well ventilated, lighted, and supplied with water, and each table is furnished with two gas lights. The rooms are admirably adapted for the purpose.

II. MUSEUM.

The Museum, besides the usual osseous, nervous, vascular, muscular, ligamentous and other preparations for anatomical demonstration, contains a large number of wet preparations relating to pathology, obstetrics, surgery, &c., an ample collection of diseased bones, calculi, models in wood, plaster and wax, and an extensive series of paintings and engravings, representing the healthy and morbid condition, fractures, dislocations, tumours, &c. &c., and the surgical operations that are necessary for their relief. The collection has been made with express reference to class demonstration, and is well calculated for illustrating the lectures on the various branches taught in the school.

III. LECTURES.

The following sketch of the general course of instruction by the several professors, will afford some idea of the order in which the subjects are treated. In the brief space afforded by an announcement like the present, it is obviously impossible to give more than a mere outline.

1. INSTITUTES OF MEDICINE AND MEDICAL JURISPRUDENCE.

Professor Dunngison.

The Chair of Institutes of Medicine embraces the doctrine of the Functions of the body as executed in health—or Physiology proper, with its applications to Pathology, Hygiène and Therapeutics. As the first and last branches, however, fall under other chairs, the relations of Physiology to them are touched upon briefly.

It is the object of the Professor to teach fully the doctrine of the healthy function, as the only true point of departure for every pathological consideration. With this view, after describing the formation of the tissues from the germinal cell of modern physiologists, and alluding as far as his time will permit to the modern doctrines of Histology or the development of the tissues, he takes up the functions successively, and passes through 1. The Vital, comprising Ingestion, Respiration and Circulation: 2. The Nutritive, comprising Digestion, Absorption, Nutrition, Cataract and Secretion: 3. The Animal, comprising Sensibility and Muscular Motion: and 4. The Generative.

In pointing out the healthy manifestations,—of Respiration for example,—he first describes the anatomy of the apparatus, but so far only as is necessary for comprehending the function: the physical and chemical properties of atmospheric air in their hygienic and other relations to the subject; the mechanical and chemical phenomena of respiration, and the nature of the sounds rendered in health, on percussing and auscultating the chest, follow in due order: the main pathological aberrations are next investigated, and general inferences of a therapeutical character deduced.

In the elucidation of the various subjects, the eye is addressed as much as possible. Where advisable, experiments are shown; and preparations, casts, engravings and drawings are largely employed.

Throughout the course, the applications of the various subjects to Medical Jurisprudence are dwelt upon; and, towards its termination, lectures are given upon medico-legal topics that had not already fallen under consideration.

The Books that may be referred to by the Student, as accompaniments to the course, are the Professor's Human Physiology, his Elements of Hygiène, and Beck's Medical Jurisprudence, or Traill's Syllabus on the same subject with notes by the Professor.

2. MATERIA MEDICA AND GENERAL THERAPEUTICS.

Professor Huston.

The lectures delivered on this branch, embrace the general principles of the administration of medicines, and the indications which the different articles of the Materia Medica are capable of fulfilling.

Impressed with the essential importance of rational therapeutics, and holding that it is impossible to practise medicine satisfactorily or successfully without a well grounded knowledge of the modes of operating on medicines, the Professor devotes much time and attention to this branch of his department,—first, in the introductory part of the course, and subsequently, when discussing each class of remedies and the properties of the individual articles.
Under the Materia Medica, the different modes of teaching it are considered. That which regards the various articles as therapeu
tical agents is preferred, as more immediately instructive to the student and interesting to the practitioner. A minute knowledge
of the commercial and natural history of drugs, and in many cases of their mode of preparation on the large scale, although
important to the apothecary and dealer in drugs, is less so to the
practitioner of medicine than a thorough acquaintance with their
doses, modes of administration and therapeutical properties, and
with the substances that are incompatible with them.

After treating of the general laws of Therapeutics, the various
articles of the Materia Medica are arranged under three great
classes of Vital Agents, Chemical Agents, and Mechanical
Agents. These, again, are subdivided according as they are
known to affect different tissues or functions of the body. Every
article spoken of, is exhibited to the class, with a brief account
of its natural history, physical, chemical and therapeutical pro
perties, dose, and mode of administration; the substances which
are incompatible with it are then carefully pointed out. The inferior
qualities and adulterations of important medicines are likewise
described, so as to enable the student readily to distinguish be
 tween genuine and inferior or spurious articles.

In order to render the course as demonstrative as possible, the
Professor is provided not only with an extensive cabinet of
genuine and spurious drugs, and dried specimens of the vegetable
Materia Medica, in frames under glass, but also with magnified
drawings, colored, of most of the important indigenous articles.
He has likewise an opportunity of exhibiting to the class foreign
and indigenous plants in their growing condition.

The Books recommended as accompaniments to the course,
are Dunglison’s Therapeutics and Materia Medica, and the Dis
pensatory of the United States, by Professors Wood and Bache.

3. GENERAL, DESCRIPTIVE, AND SURGICAL ANATOMY.

P R O F E S S O R P A N C O A S T.

The course of lectures in this department comprises a faithful
demonstration and description of the entire structure of the human
body. Though the Professor, from the abundance of the material
necessary to anatomical pursuits, is enabled in every case to
resort to the recent dissection for illustration before his class, yet,
from much experience, he has found it indispensable to avail himself
of accessory means, in order to enable the student, whose time is
necessarily otherwise much engrossed, to form a satisfactory
acquaintance with this important subject. For the exposition of
parts, which are minute and complicate, he is provided with large
and accurate models, so constructed that the parts can be taken
asunder and replaced, thus furnishing the pupil with the double
advantage of studying them by the analytic and synthetic methods.

In general anatomy, which has become recently of such great
value in its application to physiology and practice, frequent re
course is had to highly magnified drawings, by which the Pro
fessor is enabled to convey a better knowledge of the growth and
structure of parts, than he has found it possible to do by dissections
and preparations alone. But he does not cease to remember,
throughout his course, that the uses of anatomy, and the objects
for which it is mainly studied, are its applications to practice.
In the study of osteology and anthropology, he is careful by
taking—as much as possible—the bones and ligaments together,
to convey with their general description that knowledge of their
structure which will prove most useful in the treatment of surgical
affections. Whilst faithfully demonstrating the muscular system,
and exhibiting the simple and variously combined action of the
muscles, he dwells most on those that are concerned in fractures
and luxations, and in the production of deformities. In splanchnic
ology and angiology the same objects are held in view. In the
study of the thorax, care is taken to furnish that knowledge of
the relative position of the lungs, heart and vessels, which is so
important in auscultation and percussion; in that of the abdomen
and pelvis, besides the minute detail of the structure of the parts
concerned,—the varying position of many of the organs, the
passages through which hernial protrusions may occur, the re
gions that are most frequently the seat of abscess, and the modes
by which, in operations, the visceræ may most readily be reached
with instruments, are particularly illustrated. The arrangement
of the fascia, and the surgical anatomy of the arteries are care
fully described, and frequent reference is made on all subjects
requiring them—to enlarged paintings, in order to enforce the
clearness of the demonstrations. As the relative or topographical
anatomy of the organs is that which is most important to the
Practitioner, care is taken—so far as this can be done without
disadvantage to special anatomy—to lay bare, and describe
the parts together, as they are found in the body.

The Books, recommended by the Professor to accompany his
course, are his edition of Wistar’s Anatomy, or Horner’s General
and Special Anatomy, and Quain’s Anatomical Plates, edited by
the Professor.

4. PRACTICE OF MEDICINE.

P R O F E S S O R M I T C H E L L.

In this branch of medical science, the Professor endeavors to
present a concise but comprehensive view of the actual state of
his department. While he leads the Student carefully through every
useful division of his subject, pathological and practical, he, for
obvious reasons, dwells minutely on the recently acquired know
ledge of diseases of the heart and organs of respiration, and en
deavors to give as clear an account as possible of the physical
indications of this interesting and important part of professional knowledge, and of the mode of using the stethoscope, plexor and pleximeter. The late discoveries in pathology and practice in renal diseases; the novel views of the character of fevers; and the more exact ideas respecting many of the hepatic and cutaneous affections held by living authors, are among the subjects of patient examination. Every proper effort is made, by preparations and drawings, to convey a lively conception of the truth to the mind of the pupil.

The Books of reference for this department, are Dunglison's Practice of Medicine, and Stokes' and Bell's Practice.

5. INSTITUTES AND PRACTICE OF SURGERY.

PROFESSOR MUTTER.

In the arrangement of his course the Professor adopts, as a basis, the classification, according to which all surgical diseases are brought under three principal heads.

1st. Those which affect all organic tissues,—as Inflammation, Scrofula, Scorbatus, Cancer, Fungus Harmatodes and Wounds.

2dly. Those which affect each tissue separately; in the consideration of which, the Professor begins at the surface and proceeds to the centre of the body.

3dly. Those which involve the several regions.

The first group includes all the subjects which belong to "General Surgery," or what is commonly called the "Principles of Surgery." The second, all the diseases of the skin, cellular tissues, veins, arteries, muscles, tendons, fibrous tissues, bones, joints, and nerves, to which group the phrase, "Surgery of the Tissues" has been applied. Lastly, follows the third class,—diseases of the eye, the nose, the ear, the head, the digestive apparatus, the abdomen, the respiratory apparatus, the urinary apparatus, the genitals, and the rectum and anus, or what may be termed "Regional Surgery."

The different surgical operations are thoroughly explained, and exhibited on the dead subject—and many of them are shown upon patients who attend the "Surgical Clinique" of the Institution.

The excellent museum belonging to the College, and the Professor's own extensive private collection of drawings, casts, and models, enable him to promise as full and as practical a course as can be delivered on his branch in the time allotted.

The Books of reference are Liston's Elements of Surgery, Liston's Practical Surgery, S. Cooper's First Lines, or Druitt's Surgery. A text-book by the Professor is in preparation, and will be published as speedily as possible.

6. OBSTETRICS, AND DISEASES OF WOMEN AND CHILDREN.

PROFESSOR MEIGS.

The course on Obstetrics, and the Diseases of Women and Children, will comprise a minute description of the structure and uses of the Pelvis in its relations to obstetrics. The soft parts will be considered, both as the seats of disease and as the agents in reproduction, gestation and labour: Pregnancy in its physiological and pathological states, will undergo a full discussion and explanation, and Labour in every variety will be explained to the class: its accidents, difficulties and obstructions, will be carefully exposed, with the most esteemed modes of treating the several cases.

Various obstetric instruments and appliances will be exhibited, and the whole course will be illustrated by paintings, engravings and preparations; with frequent citations of celebrated cases and opinions, aided by examples drawn from the current experience of the Professor.

The Books recommended to accompany the course are the "Philadelphia Practice of Midwifery," and the translation of Velpeau's Midwifery.

7. CHEMISTRY.

PROFESSOR BACHE.

In this course a systematic view is presented of the science, with its applications to Medicine. Several of the first lectures are devoted to general considerations and the imponderables, after which ponderable substances, whether inorganic or organic, are successively treated of. All the important chemical substances, embraced in the United States and British Pharmacopoeias, are shown and described; the order in which they are taken up being determined by the classification pursued, which throws them into natural groups. Organic Chemistry, embracing animal and vegetable substances, is treated of as fully as the time will permit.

The instruction in this department is interspersed with remarks on the applications of the chemical facts to Physiology, Pathology, Therapeutics and Toxicology.

The course is illustrated by numerous experiments, for which a suitable apparatus is provided. Frequent use is made of diagrams and explanations on the black board, in elucidation of various points not otherwise readily comprehended by the student.

In connection with the lectures, the student is recommended to read Turner's Chemistry, 6th edition, and the chemical articles of the U. S. Dispensatory.

IV. CLINICAL INSTRUCTION.

The students of the college participate in all the advantages derivable from an attendance on the Philadelphia Hospital and the Pennsylvania Hospital,—the lectures being so arranged as to admit of their visiting these valuable establishments for instruction on appropriate days. Every Saturday during the course Professor Dungan lectures on Clinical Medicine, and Professor Pancoast on Clinical Surgery, at the Philadelphia Hospital; the subjects of clinical instruction being carefully selected to elucidate
the lectures delivered at the College, and to convey as large an amount of practical information as possible. Various surgical operations are performed by Professor Pancoast, and ample opportunities are presented to the students for becoming practised pathologists.

The students can likewise avail themselves of the advantages to be derived from Will's Hospital for diseases of the eyes, and the Philadelphia Dispensary. These Institutions afford facilities for witnessing medical and surgical practice.

The Students of Jefferson Medical College have, moreover, the exclusive privilege of attending a General Dispensary attached to the College, at which upwards of 1000 cases have been treated in the course of the year. The patients are examined and prescribed for by the physician and surgeon in attendance; detailed histories of the cases are kept, and patients are entrusted to the students, under the direction of the Professor. Opportunities likewise occur for obstetrical practice.

During the last session a "Clinique" was held by the Professors of Surgery and Anatomy, at which numerous operations were performed; and at this time, the Dispensary is in active operation, under the superintendence of a physician and a surgeon from amongst the Professors of the School. The Dispensary offers to the student an extensive field for witnessing and participating in the practical exercise of his profession.

**OPERATIONS**

**Performed at the "Clinique" since November 1st, 1841.**

**BY THE PROFESSOR OF SURGERY.**

Besides these, many cases operated on in private were exhibited to the class in progress of cure; and all were exclusive of the great number of cases operated upon by the Professor of Anatomy at the Philadelphia Hospital.

A very large number of surgical cases, comprising wounds of different parts, syphils, gonorhrea, ulcers, scrofula in all its forms, contusions, sprains, fractures, luxations, hernia, varicose veins, diseases of the skin, diseases of the eye not requiring operation, diseases of spine, deformities, &c. &c., have also been treated at the Clinique.

**V. PRACTICAL ANATOMY.**

The Dissecting rooms are under the charge of the Professor of Anatomy, and of Dr. J. M. Allen, Demonstrator. The material for dissection is so abundant as to enable the student to prosecute his labours with full advantage. The Demonstrator, who has had much experience in teaching this branch of science, will be in constant attendance, directing him in his course, explaining the parts, with their various surgical relations, and familiarising him with the use of surgical instruments. Vesical anatomy, of such great importance to the medical practitioner, receives a particular share of attention; and, to enable the pupil to study it with more facility, drawings of the natural and enlarged size, and dried preparations are kept at hand for reference.

In the morbid alterations of the organs, care is taken to point out to the student the degree of variation from the healthy standard, and to make him familiar with such recent researches in pathology as bear upon the lesion. To prepare him for what he is about to investigate with the knife, the Professor is in the habit of giving, in the anatomical theatre, evening lectures to the class, on the more difficult portions of the science, as the brain, pelvis, perineum, and such other parts as are concerned in the more important surgical operations. This surgical or dissecting room anatomy does not, however, interfere with, but rather prepares the way for, the thorough comprehension of the systematic course of lectures on General, Descriptive, and Surgical Anatomy, given in the day time.
VI. REGULATIONS, &c.

The regular course of lectures will commence on Tuesday, the first of November, and end on the last day of February.
During the month of October, the anatomical rooms are open, and the Professor of Anatomy and the Demonstrator give their personal attendance thereto. Clinical instruction on Medicine and Surgery is likewise given at the Dispensary of the College.

The examination of candidates for graduation commences on the first of March.
The candidate must be of good moral character, and at least twenty-one years of age.
He must have attended two full courses of lectures in some respectable Medical School, one of which, at the least, shall have been in this College, and must exhibit his tickets, or other adequate evidence thereof to the Dean.
He must have attended at least one course of clinical instruction in an Institution approved by the Faculty.

He must present to the Dean of the Faculty a thesis of his own composition, correctly written, and in his own handwriting, on some medical subject, and exhibit to the Faculty, at his examination, satisfactory evidence of his professional attainments.

If, after examination for a degree, the candidate, on ballot, shall be found to have received three negative votes, he shall be entitled to a fresh examination. Should he decline this, he may withdraw his thesis, and shall not be considered as rejected.

The degree will not be conferred upon any candidate who absent himself from the public commencement, except by special permission of the Faculty:
The Faculty, desirous of encouraging deserving individuals, whose means may be insufficient, admit ten beneficiaries to the lectures. Application must be made in writing, to the Dean of the College, (postage paid,) on or before the first day of September, and satisfactory evidence be furnished of the good moral character, respectable literary attainments, and other claims of the applicant.

For this privilege, the beneficiary is required to pay into the treasury in addition to the matriculation fee, the sum of twenty dollars towards the incidental expenses of the Institution.

VII. FEES.

The fee for admission to each course of lectures is fifteen dollars.
The matriculation fee is five dollars. The Student is only required to pay this for the first session, which he attends in the College.
The fee for the diploma is thirty dollars.

* The price of boarding, and all the personal expenses of the Student are at least as reasonable in Philadelphia as in the other large cities of the Union.
