A 48-year-old female with multiple myeloma (MM) and amyloidosis presented with massive upper gastrointestinal (GI) bleeding one week after autologous stem cell transplantation (autologous-SCT). Esophagastroduodenoscopy (EGD) demonstrated necrotic, purple, pigmented, friable lesions throughout the stomach (Figure 1a), along with a bleeding ulcer in the cardia (Figure 1b, Video 1) which was successfully treated with epinephrine (1:10,000) injections. Biopsies demonstrated nodular amyloid deposition (Figures 2) which was Congo red positive. The patient had no further hematemesis and was discharged home 4 days later. Ten months after autologous-SCT, EGD revealed a normal stomach (Figure 3, Video 2) with no histologic evidence of amyloid.

AL amyloid of the GI tract involves the stomach in 8% of cases [1]. Only 1% with gastric amyloidosis manifest symptoms such as bleeding [1,2], which has been attributed to light chain deposition in blood vessels causing increased friability and eventual bowel infarction [2,3]. Characteristic endoscopic findings include thickened folds, mucosal erosions, submucosal hematomas, ulcerations and mucosal friability [2]. Histology demonstrates deposition of amorphous hyaline material on H&E stain which is Congo-red stain positive. Treatment of AL amyloid is aimed at the underlying plasma cell disorder in order to decrease light chain production. High-dose melphalan followed by autologous-SCT induces a complete hematologic response, along with reversal of amyloid dependent organ dysfunction, in a majority of patients in about 3 months [4,5]. This therapy may be associated with significant toxicity, especially in patients with underlying cardiac disease.

There is very limited published data documenting reversal of symptomatic GI amyloid with MM therapy [4,5]. We believe this is the first reported case of complete endoscopic and histologic resolution of GI amyloid, particularly amyloid induced GI bleeding, following autologous-SCT. In carefully selected patients with MM, high-dose melphalan followed by autologous-SCT may be effective for symptomatic AL amyloid of the GI tract.
