ABSTRACT
Improving patient care by providing teaching sessions to hospital and clinic staff. The staff include medical assistants, technicians, and front office staff. The desired result would be to create an environment of scientific curiosity and improved understanding, for what the patients are dealing with. Thereby improving empathetic care when interacting with the patient.

METHODS
1. Presentations of 15-20 minute durations
2. Topics were chosen based on chief complaints frequently seen and specific to the patient population served (Fig 2).
3. Collect feedback via closed meetings with clinic staff

RESULTS
The presentations were well received and helped clinic staff feel more empathetic towards the patients' conditions.

CONCLUSION
Although anecdotally the project was successful, a more rigorous quantitative or more comprehensive qualitative way to measure success needs to be contrived.

A lasting contribution to the clinic is that a childhood vaccination PowerPoint presentation created during the course of this project will be used for new hires.
