This Article is brought to you for free and open access by the Jefferson Digital Commons. The Jefferson Digital Commons is a service of Thomas Jefferson University’s Center for Teaching and Learning (CTL). The Commons is a showcase for Jefferson books and journals, peer-reviewed scholarly publications, unique historical collections from the University archives, and teaching tools. The Jefferson Digital Commons allows researchers and interested readers anywhere in the world to learn about and keep up to date with Jefferson scholarship. This article has been accepted for inclusion in Jefferson Surgical Solutions by an authorized administrator of the Jefferson Digital Commons. On the Job

Donna Guinto, C-TAGME
Certified Training Administrator of Graduate Medical Education Programs

Donna Guinto is a 22-year employee of Jefferson who has worked as the Coordinator of the Surgical Residency Program since 1994. She manages the administrative and supervisory activities of the 51-resident program.

**How do you prepare for selecting next year’s residents?**

In September, I begin downloading applications. I do the preliminary screening with the attendings doing the final review. This year we received close to 1100 applications. It’s a highly competitive process, with only six slots available each year.

**What qualities do you seek in an applicant?**

In addition to academic achievement, preparedness, and communications skills, we select candidates based on qualities such as motivation, honesty, and integrity. We look for team players — people whose determination is fueled by a personal commitment to helping others — patients and colleagues alike.

**How do residents benefit from Jefferson's rich academic tradition?**

Jefferson was the second hospital in the U.S. to be directly associated with a medical school — a real pioneer in combining patient care with formal education. In the mid-1850s, the department prospered under the leadership of Samuel D. Gross, MD, known then as the "Emperor of American Surgery." Our faculty carry on his legacy of surgical innovation and passion for clinical education.

**What are some of skills that your job requires?**

Multitasking – I manage the logistics of the program such as residents' work hours and schedules and monitor accreditation, board, and institutional requirements. I document the evaluation processes and counsel residents in solving problems in their personal and professional lives. It’s a big job, but it comes with great satisfaction, too.

Innovative Therapies for Pancreatic-Related Cancers

Pancreatic cancer patients come to Thomas Jefferson University Hospital because of the reputation, skill, and track record of its surgical staff, who perform a high volume of surgeries. However, this patient-centric approach to care is supported by an impressive research capability that also has significant impact on both the prevention and recovery of pancreatic-related diseases.

Two world-class Jefferson researchers, Houda Arafat, MD, PhD, and Jonathan Brody, PhD, are making tremendous inroads toward understanding the science and genesis of pancreatic-related cancers. Their goal is to manage or halt the progress of disease through innovative and diverse therapies. Dr. Arafat, Assistant Professor of Surgery, has a PhD in cell biology and immunology. A native of Egypt, she is currently investigating pancreatic cancer as it pertains to the renin-angiotensin system involved in hypertension. She is also interested in the use of anti-hypertension medications already on the market to help treat pancreatic cancer. “I have the patient on my mind everyday,” she says. “It is my motivation, my hope that our research can help to make the disease manageable.”

In 2005, when Dr. Arafat began a multidisciplinary approach in the lab that parallels her work in the clinic, she began to see correlations between patients who received hypertension medications and a decrease in cancer occurrences. “Clinical trials are just a year away that will help us understand whether the hypertension therapies work, as well as the science behind them,” explains Dr. Arafat.

Jonathan Brody, PhD and Houda Arafat, MD, PhD, conduct research that will lead to new pancreatic cancer treatment options.

Since joining the Jefferson faculty as Assistant Professor in 2006, Dr. Brody has concentrated on the complex molecular genetics of pancreatic cancer. After earning a PhD from the Johns Hopkins School of Medicine, he completed post-doctoral training in oncology with Scott E. Kern, MD, who is world-renowned for his work in the genetics of pancreatic cancer. Together they led up to making a cell cancerous,” he says.

“Clinical trials are just a year away that will help us understand whether the hypertension therapies work, as well as the science behind them.”

Innovative and diverse therapies are yielding very positive results. “We will then have isolated the molecular defects—what went wrong—and find a better, more targeted, and sophisticated approach for drug therapies.” Dr. Brody explained that, just as we now know which antibiotics work best for specific bacterial strains, “we are striving to do the same for pancreatic cancers, and we are already seeing some very positive results.”

Doctors Arafat and Brody are at the forefront of research in the field today. Dr. Arafat was one of the Jefferson physicians to represent Jefferson at the distinguished 2006 Southern Surgical Association Meeting in Florida last November, where she presented some of her recent findings. It is their goal to leverage this work in the lab to ensure that patients survive pancreatic cancer in increasing numbers and go on to live long and healthy lives.
